eNET Monitoring & DNC proudly announces release of major Machine Monitoring Software updates, eNET V9.1 and eNET LT V5.1

May 2, 2022

Greenfield, WI- eNET Monitoring & DNC is pleased to announce the release of two highly anticipated machine monitoring software updates- eNET V9.1 & eNET LT V5.1. The new versions have been updated with two new machine monitoring dashboards (Detailed Timeline & Detailed Graph) that display the shift goal for machine cycles that can be accomplished per shift, and the achievable cycles that can still be completed on the current shift. These dashboards also display how many cycles were done on previous shifts, the machine monitoring timelines of previous shifts and a pie chart of the machine utilization for the current shift. The new software versions also provide improvements to the legacy machine monitoring dashboards, as the interface code has been refreshed to operate even faster and allow for more visual customizations of the dashboards. A new API that is over 200% faster has been added to talk to eNET partner softwares, and the SQL interface has been refreshed to improve ease-of-use and offer more features. These American-made software updates are available for every eNET Machine Monitoring customer as a complimentary download from the www.enetdnc.com website, as eNET Customers always enjoy free software updates and phone support, without the hassle of yearly maintenance fees.

Company Profile
eNET Monitoring & DNC is the industry leader in providing secure American-made DNC & Machine Monitoring solutions, serving the smart manufacturing industry for over 30 years.
